

## **ABSTRACT OF THE DISCLOSURE**

In various embodiments, a leak diversion device may be coupled to a device, such as, but not limited to, a domestic or industrial device, for diverting a fluid that is released from the device. In some embodiments, a surface in the leak diversion device may be angled for diverting the diverted fluid to a predetermined location exterior to the device where a user may see the fluid. A hose may also be used to divert the fluid out of the leak diversion device. In some embodiments, the leak diversion device may have a permeable surface and/or enforced sides to provide level support for the device while allowing fluid released from the device to drop onto a slanted surface to be directed away from the device. In some embodiments, dye tabs may be used in the leak diversion device to add color to the fluid to make the fluid more visible.
